

Conexant Systems - Shanghai, China Design and Project Management

Conexant Systems, a leader in semiconductor solutions for broadband communications, asked AsiaPac International to help with the construction of 3 floors in their Shanghai office. AsiaPac had previously worked with Conexant Systems in some of the company's Asian offices such as in Shenzhen, Chengdu, and Seoul. The excellent work performed by our team in those locations led to this new assignment.

Conexant asked AsiaPac to build two labs for the purposes of failure analysis testing, office space, and a reception over the three floors. The necessity of some major equipment for the failure analysis lab meant that special environmental care was taken when planning and building the failure analysis lab. In addition, Conexant had already occupied the building so it was decided that the project would be completed in two phases in order to be able to keep Conexant people working and avoid the additional costs of renting a serviced suite or having employees work from home. The build out was done quickly and efficiently, coming in a few weeks earlier than the construction schedule had allowed. Conexant relies on AsiaPac international and its affiliates for just this reason, tough requirements can be handled on time a continent away.
